

Android Application Development

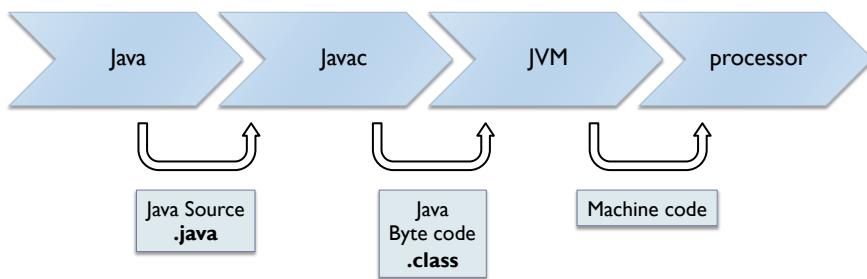

Amit Gulati, amit.gulati@gmail.com

1

Android Architecture

► Java Virtual Machine

- Java byte code requires an JVM that converts the byte code to native instructions

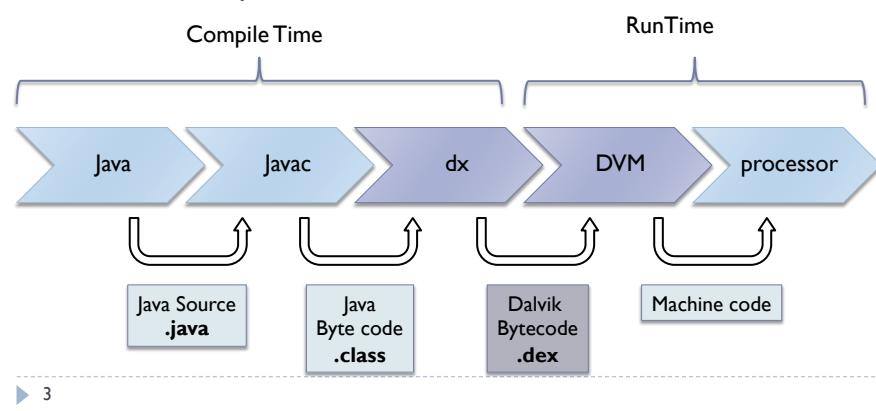

► 2

2

Android Architecture

► Dalvik Virtual Machine

- ▶ Default with Kitkat and below
- ▶ Optimized for mobile and embedded devices
- ▶ Runs Dalvik byte code or “.dex” files.

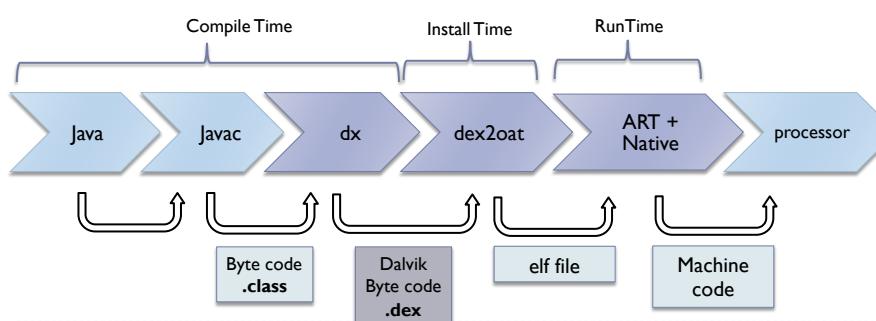

3

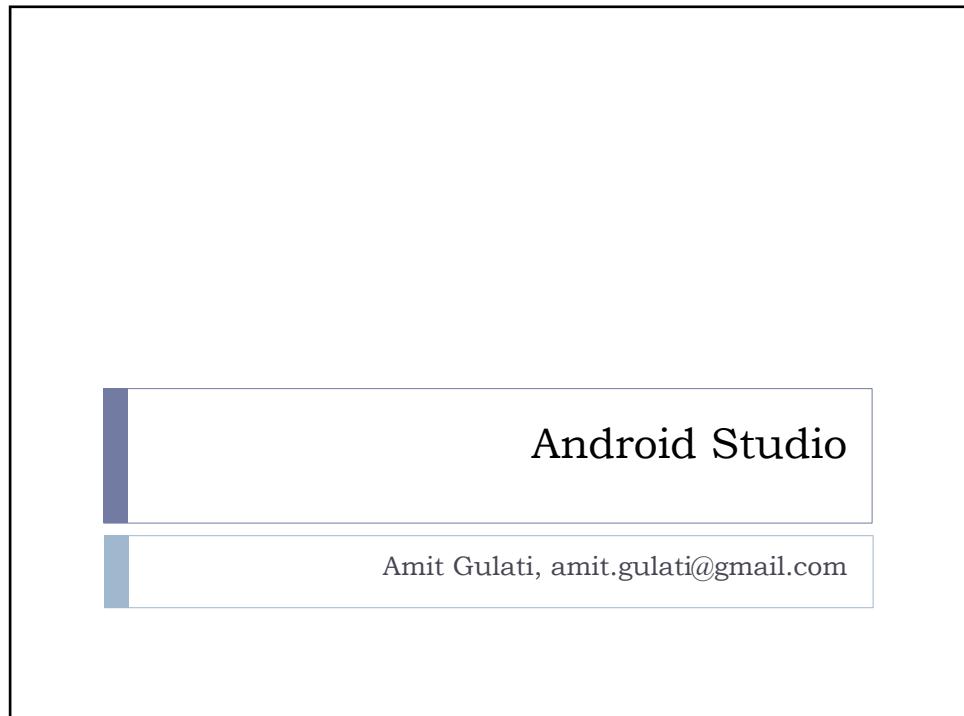

Android Architecture

► ART

- ▶ Default with Lollipop and above
- ▶ Ahead-of-time (AOT)
- ▶ Improved Garbage Collection
- ▶ 64bit support

4

6

Android Studio

▶ Installation

▶ Download location

<https://developer.android.com/studio>

android studio 

Android Studio provides the fastest tools for building apps on every type of Android device.

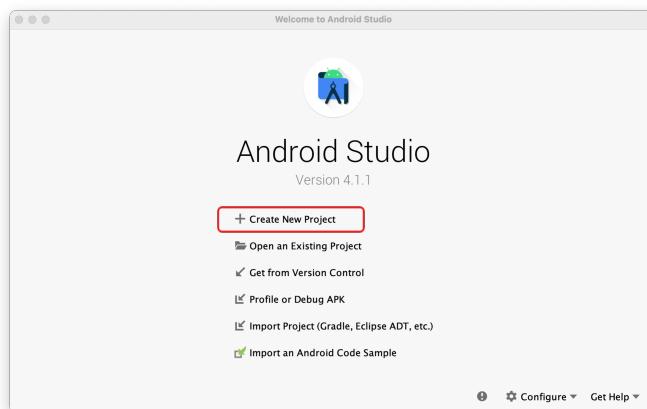

[DOWNLOAD ANDROID STUDIO](#)

▶ 7

7

Android Studio

- ▶ Start Android Studio
- ▶ Select “Create New Project”

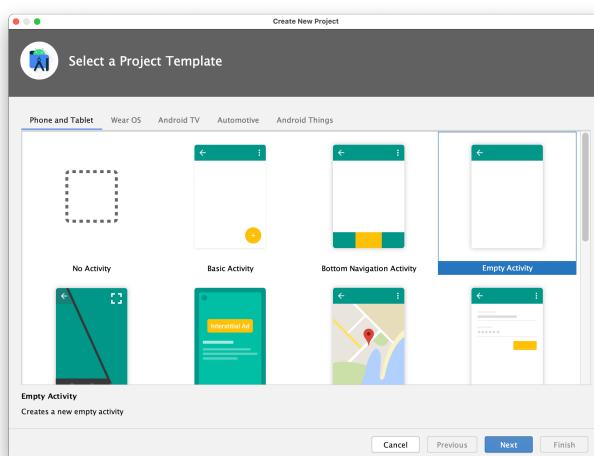

▶ 8

8

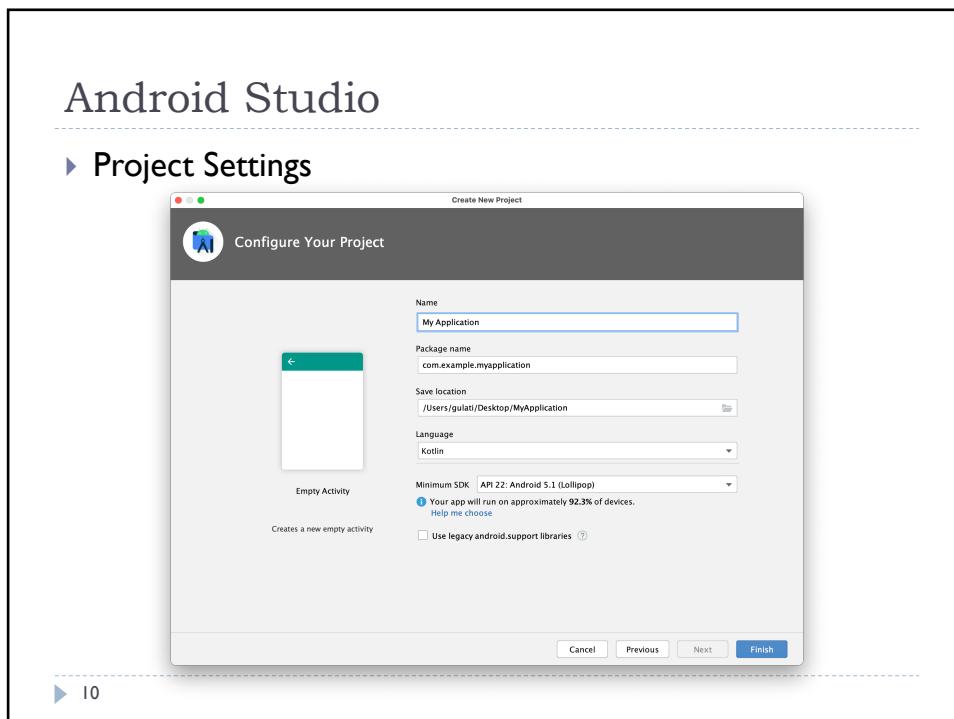

Android Studio

- ▶ Project Template

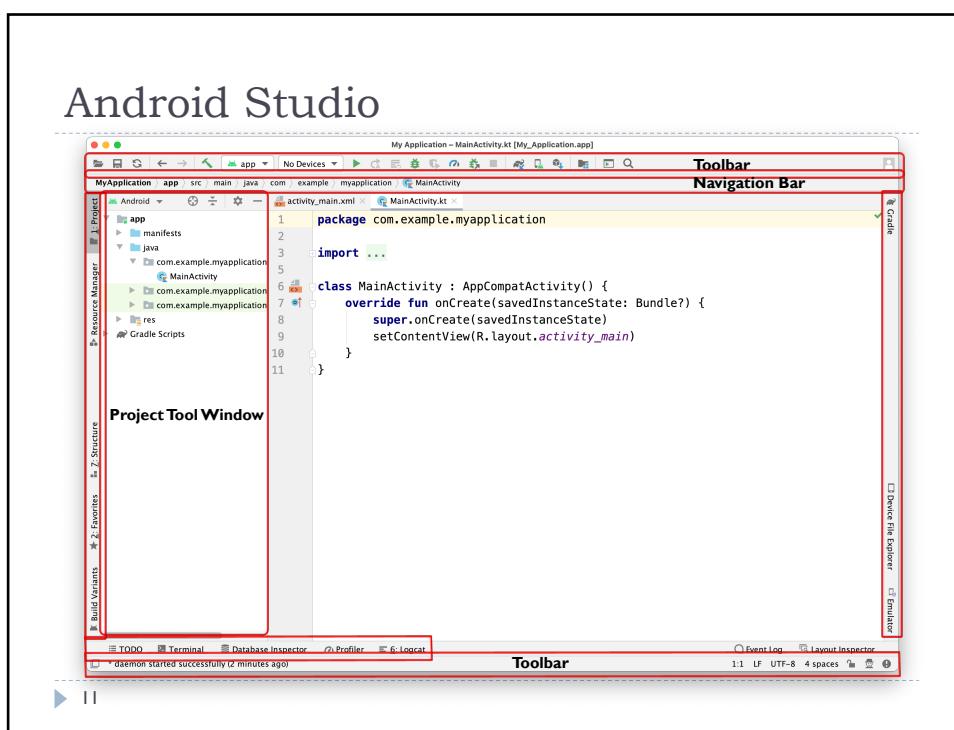

▶ 9

9

10

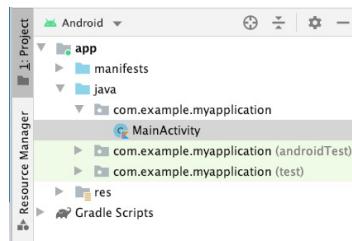

11

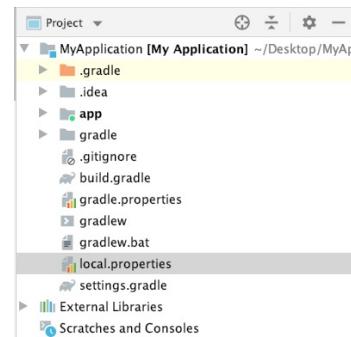

Android Studio

▶ Project Tool Window

Android View

Project View

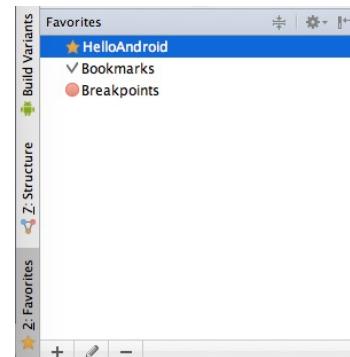

▶ I2

12

Android Studio

▶ Favorite Tool Window

- ▶ Logically group references to related files
- ▶ Contains 3 sections
 - ▶ Favorites
 - Files can be added to Favorites sections.
 - ▶ Bookmarks
 - Allow you to navigate to any line in a file.
 - ▶ Breakpoints

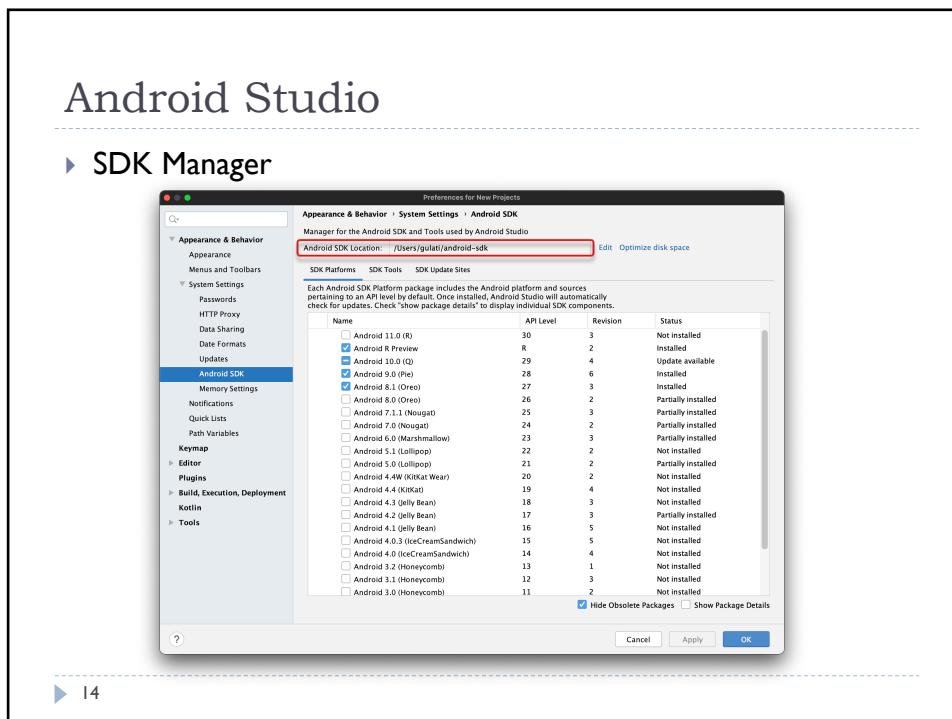

Favorite (⌘ ⇧ f)

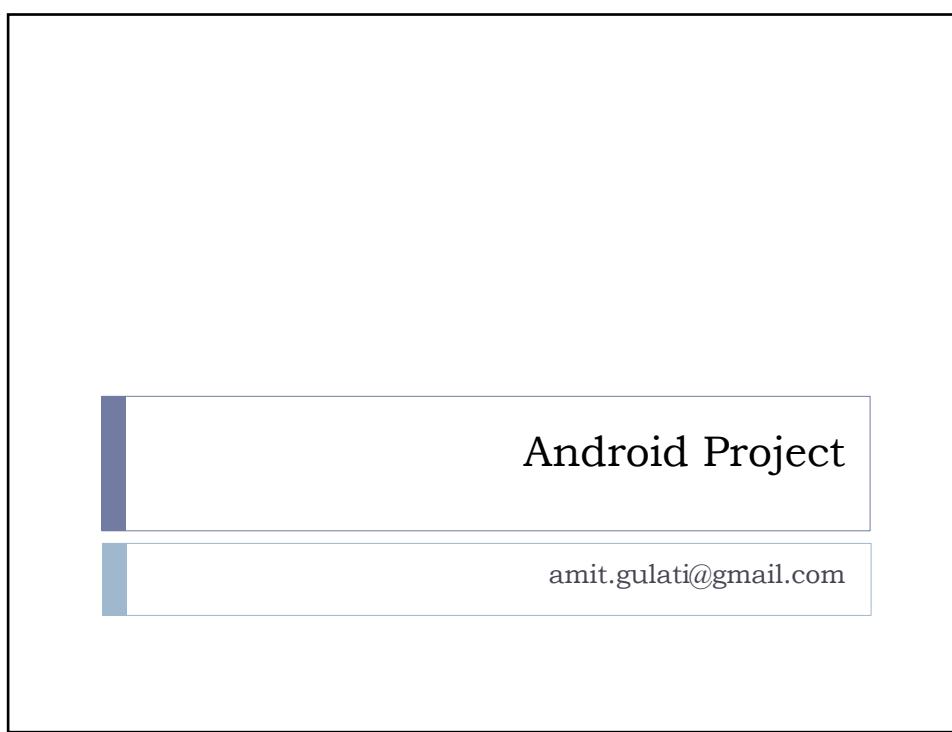

Bookmark (fn F3)

17

Android Studio

▶ Project View: File/Folder structure

```

    graph TD
        MyApplication[My Application] --> .gradle
        MyApplication --> .idea
        MyApplication --> app
        app --> libs
        app --> src
        src --> androidTest
        src --> main
        main --> java
        main --> res
        res --> AndroidManifest.xml
        res --> test
        test --> .gitignore
        test --> build.gradle
        test --> proguard-rules.pro
        gradle
    
```

- "app" project folder where your application code reside
- "libs" folder that contains the libraries referenced from our code.
- "androidTest" Contains the instrumentation tests
- "test" Contains unit tests
- "build.gradle" script used to build our application.

▶ 18

18

Android Studio

▶ Project View: File/Folder structure

```

    graph TD
        main --> java
        main --> res
        res --> drawable
        res --> layout
        layout --> activity_main.xml
        layout --> mipmap-hdpi
        layout --> mipmap-mdpi
        layout --> mipmap-xhdpi
        layout --> mipmap-xxhdpi
        layout --> mipmap-xxxhdpi
        res --> values
        values --> colors.xml
        values --> dimens.xml
        values --> strings.xml
        values --> styles.xml
        values --> mipmap
        values --> values-w820dp
        values --> dimens.xml
        values --> AndroidManifest.xml
    
```

- "java" folder that contains Java classes organized as packages.
- "res" folder that contains project resources such as the XML files that specify layouts and menus, or image file.
- "drawable" folder for image resources used by application.
- "layout" folder for Activity XML layout resources
- "mipmap" folder for application icon resources
- "values" folder for simple resources like strings, colors, dimensions

Application Essentials

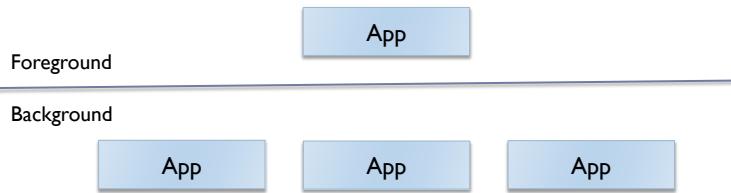

Amit Gulati, amit.gulati@gmail.com

20

Android Runtime

▶ Active vs Background Applications

- ▶ Active application
 - ▶ Application that is currently displaying content on the screen and has focus
- ▶ Background application
 - ▶ Application process is still in Memory but is not displaying content on the screen.
 - ▶ Application has restricted access to CPU

▶ 21

21

Application Essentials

► Physical Structure

- ▶ An Android application is bundled as a “.apk” file.
- ▶ .apk if a zip file

► 22

22

Application Essentials

► What is an Android Application ?

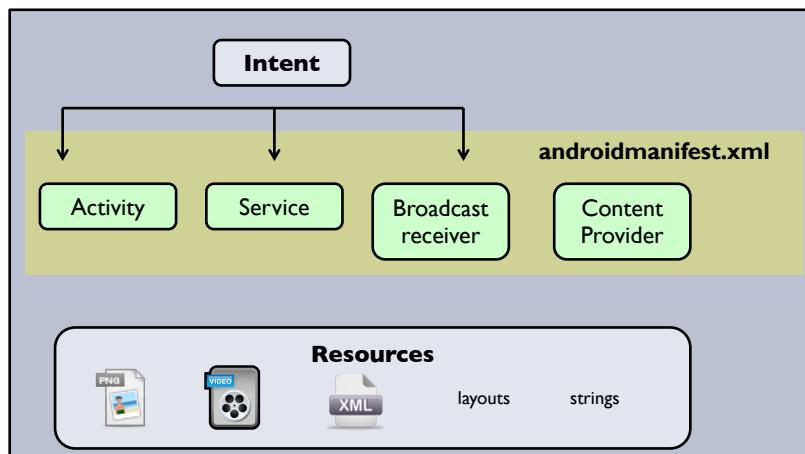

- ▶ Collection of loosely coupled Application Components
 - ▶ Activity
 - ▶ Service
 - ▶ Content Provider
 - ▶ Broadcast Receiver
- ▶ Bound together by the Application Manifest.
- ▶ Communicate with each other via Intent objects.
- ▶ Use Resources
 - ▶ Almost everything other than Java code in Android is a resource.
 - ▶ Common Resources: String, Images, Audio, Video, Layouts etc.

► 23

23

Application Essentials

- ▶ What is an Android Application ?

▶ 24

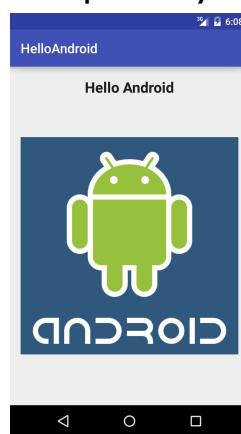

24

Application Essentials

▶ Activity

- ▶ Activities form the Presentation layer of an Android application.
- ▶ A Single Screen in your application is an Activity.
 - ▶ Covers the whole screen of device
- ▶ Activity object is given a blank window to draw.
 - ▶ Activity object is not capable of drawing in a window.

Simple Activity

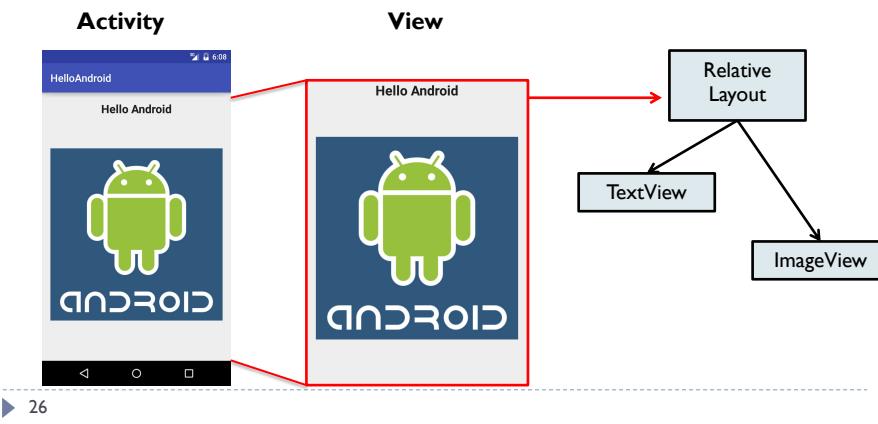

▶ 25

25

Application Essentials

▶ Activity

- ▶ Activity attaches a **View** object to itself
 - ▶ A View object can draw in the window.

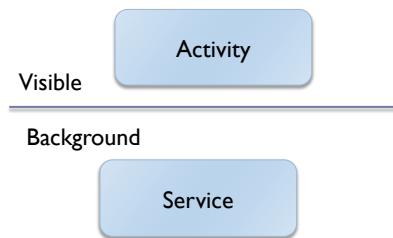

26

Application Essentials

▶ Service

- ▶ Service is an Android Application Component that runs in the background.

- ▶ Accomplish tasks that are to be run even when none of the Activities associated with an application are visible or running.

▶ 28

Application Essentials

- ▶ **Service**

- ▶ Service can be scheduled for execution in the background at a later point in time or periodically.

- ▶ **Common Use-cases**

- ▶ Playing music in the background
- ▶ Syncing Application data with remote server.
- ▶ Run scheduled tasks

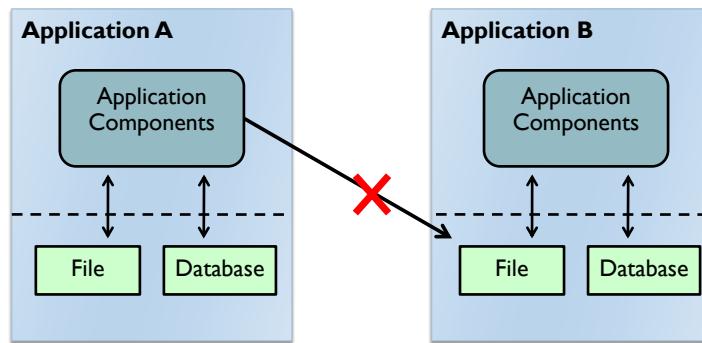

▶ 29

29

Application Essentials

- ▶ **Content Provider**

- ▶ Android Applications run in a sand-boxed environment.
- ▶ An application does not have direct access to files and directories of other applications.

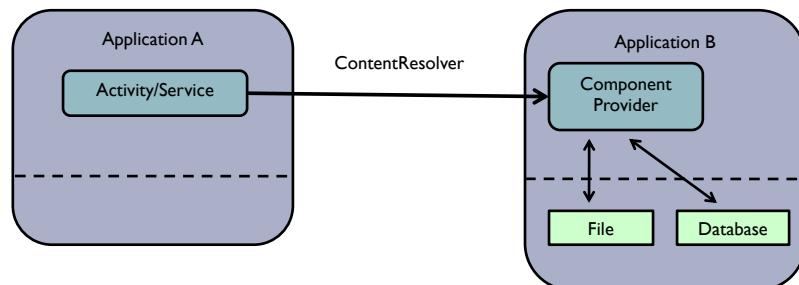

▶ 30

30

Application Essentials

▶ Content Provider

- ▶ Allows sharing data between applications
 - ▶ By implementing content provider, an application can share its data with other applications

31

31

Application Essentials

▶ Content Provider

- ▶ Android ships with a number of content providers for common data
 - ▶ call log, contacts, browser information, audio and video media etc.

32

32

Application Essentials

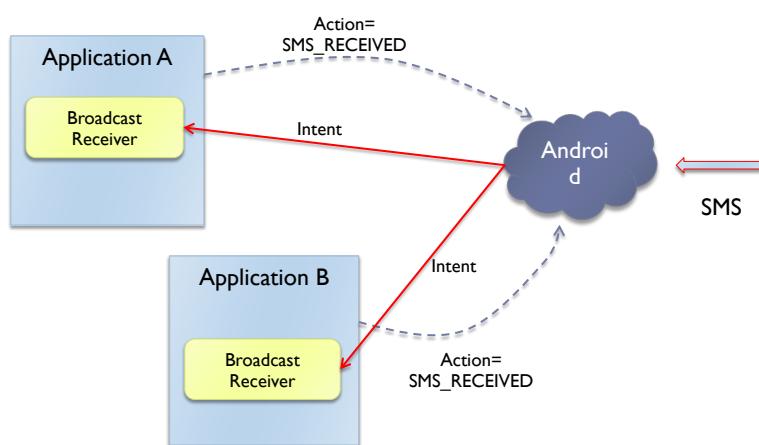

- ▶ **Broadcast Receiver**
- ▶ System and Application broadcast events.
 - ▶ Android System generates broadcasts when certain state changes occur.
 - ▶ Applications can generate broadcasts.
- ▶ Applications that want to listen for broadcasts
 - ▶ Implement Broadcast receiver component
 - ▶ Register the Broadcast Receiver for the Broadcast Action.

▶ 33

33

Application Essentials

- ▶ **Broadcast Receiver**

▶ 34

34

Application Essentials

► Broadcast Receiver

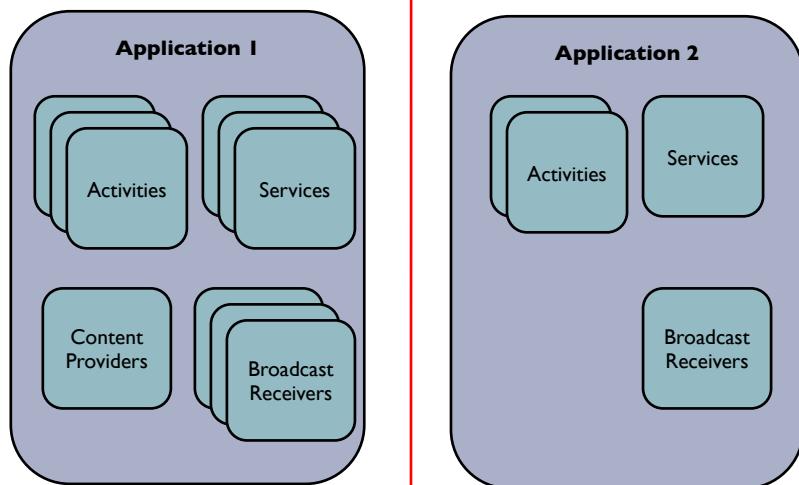

- ▶ Application with broadcast receiver does not have to be running or in background
 - ▶ Launched automatically in the background in order to execute Broadcast Receiver.
 - ▶ Executed as a result of a specific broadcast is raised by the System or an Application.
- ▶ Broadcast announcements generated by system may include:
 - ▶ Airplane mode
 - ▶ Phone call received.
 - ▶ Low battery
 - ▶ USB connection
 - ▶ Etc.

► 35

35

Application Essentials

Process Boundary

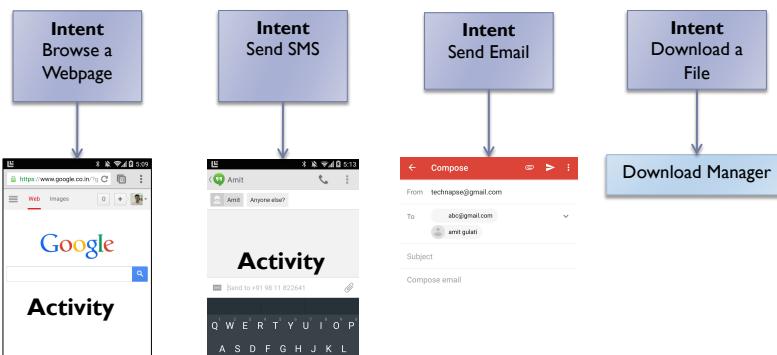

► 36

36

Application Essentials

▶ Intent

- ▶ Abstract concept that represent
 - ▶ Operation or action to be performed.
- ▶ Actions are performed via Application components

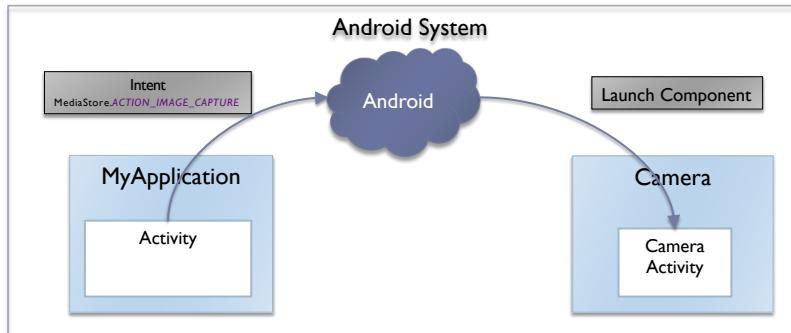

37

37

Application Essentials

▶ Intent

- ▶ Primary way for launching Application components.
- ▶ Components that are launched using Intent may be part of other applications

38

38

Application Essentials

- ▶ Intent
- ▶ Example

```
var intent = Intent(MediaStore.ACTION_IMAGE_CAPTURE)  
startActivity(intent)
```

40

40

Application Essentials

- ▶ Intent
 - ▶ Primary way for launching Application components.

- ▶ Primary way in which system / third party application send events to applications.
 - ▶ Communication between application components

41

Application Essentials

► Why Intents ?

- ▶ Re-usability & Loose Coupling
 - ▶ Use of components written by other programmers without knowing much about them.
 - ▶ To use the Camera Activity in android

```
Intent camera =
    new Intent(MediaStore.ACTION_IMAGE_CAPTURE);
```

▶ 42

42

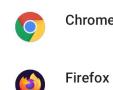

Application Essentials

► Why Intents ?

- ▶ Re-usability & Loose Coupling
 - ▶ Intents are bound to Application components at Run-time
 - ▶ In case of multiple components for an intent the user can select which one to use.

```
var intent = Intent(Intent.ACTION_VIEW)
intent.data = Uri.parse("http://www.google.com")
startActivity(intent)
```

43

43

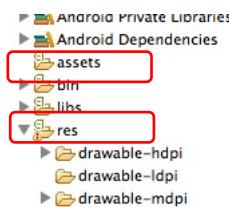

Application Essentials

► Android Application Resources

- ▶ Resources are things that are used by your application other than source code.
- ▶ Images (Icons, Splash Screen, etc.)
- ▶ XML files
- ▶ Media files (Audio, Video etc.)
- ▶ Strings, Arrays, Styles and Themes etc.

► Two folders for adding resources

- ▶ **res**
- ▶ **assets**

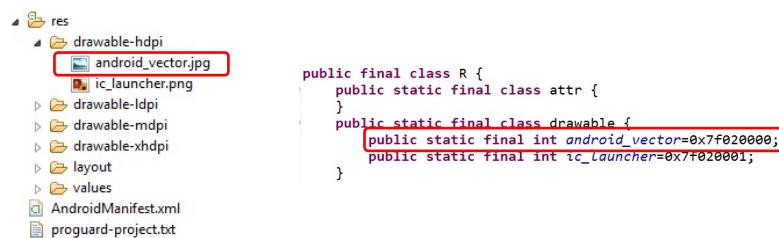

44

44

Application Essentials

► Android Application Resources

- ▶ “res” folder resources
- ▶ Android Asset Packaging Tool (AAPT) processes resources added to the “res” folder in project.
- ▶ A unique entry (ID) for each resource is placed in the R.java file.
- ▶ Resource can then be accessed in an Android project with the ID.

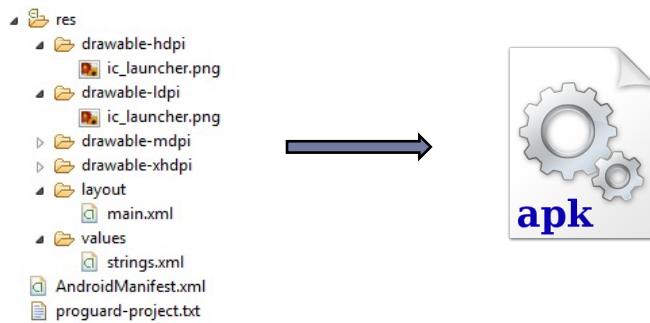

45

45

Application Essentials

► Android Application Resources

- ▶ Resources added to the application project are packaged together in the application bundle (.apk) that is installed on the device.

46

46

Application Essentials

► Android Manifest

- ▶ Every Android application package contains an Application Manifest file (androidmanifest.xml).
- ▶ Contains application meta-data, that is used by Android system.
- ▶ Application Manifest file serves the following purpose
 - ▶ Application information i.e. Name, Version, icon, etc are defined in the manifest file.
 - ▶ Used to specify hardware and software dependencies of the application.
 - ▶ Used to specify permissions required by the application.
 - ▶ Used to define the different Application components present in the application package.

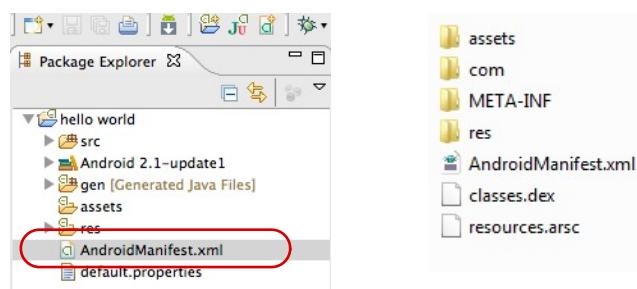

47

47

Application Essentials

► Android Manifest

- ▶ Manifest file is located at the root level in the Android project hierarchy.
- ▶ Manifest file is packaged along with executable code and resources in the .apk file.

48
